IN THE ABSTRACT

Please replace the original abstract with the following revised abstract:

A ~~retaining~~ retainer clip is used to maintain proper shoe contact and orientation for a cam actuated brake assembly. The cam actuated brake assembly includes a pair of brake shoes each having an anchor end and an actuation end. Each brake shoe is pivotally mounted at the anchor end to a brake spider with an anchor pin. When the brakes are applied, a cam acts against the actuation end causing the brake shoes to pivot about axes defined by the anchor pins. Preferably the ~~retaining~~ retainer clip is mounted to the brake shoe and includes a pair of hooks that support opposite ends of the anchor pin. The ~~retaining~~ retainer clip cooperates with the anchor pins to maintain proper shoe geometry.
